

1. What is the key difference between publishing a dashboard on Tableau Public versus Tableau Server/Cloud in terms of accessibility and data security?					
Answer:					
Tableau Public:					
Dashboards are completely public					
Anyone with the link can view and even download data					
No data security					
Tableau Server/Cloud:					
Dashboards can be restricted to specific users					
Role-based access control available					
High data security					
2. When publishing a Tableau dashboard, what happens to a live connection compared to an extract?					
How does this affect data refresh and performance?					
Answer:					
Live Connection:					
Connects directly to source database					
Data is always real-time					
Slower performance (depends on database)					
Extract:					
Snapshot of data stored in Tableau					
Needs scheduled refresh					
Faster performance					
How does this affect data refresh and performance:					
Live Connection:					
Data Refresh: Automatic and real-time — no manual refresh needed					
Performance: Can be slow if the database is large or server is under load, since every query hits the source directly					
Extract:					
Data Refresh: Requires manual or scheduled refresh (not real-time)					
Performance: Faster because data is stored in Tableau's optimized in-memory format					
3. In Tableau Server or Cloud (conceptually), which feature allows administrators to control which users can view, interact with, or edit a published dashboard?					
Answer:					
Permissions / User Roles (Access Control System)					
Admins assign permissions like View, Interact, Edit					
4. If you want users to view a dashboard but not download the underlying data, which permission setting would you adjust in Tableau Server?					
Answer:					
Adjust Permissions → Disable "Download Data"					
Users can see dashboard but cannot access raw data					
5. Name two methods by which a Tableau dashboard can be embedded into a web page or website.					
Answer:					
Embed Code (iframe)					
Tableau JavaScript API					
6. List two best practices you should follow when preparing a dashboard for public sharing to ensure data					

security and privacy.					
Answer:					
Remove sensitive/confidential data					
Use aggregated data instead of raw data					
(You can also mention: anonymize data, hide unnecessary fields)					
7. After publishing a dashboard, users report a “Data not found” error.					
What is the most common cause related to data source settings?					
Answer:					
“Data not found” error cause					
Most common cause:					
Broken or incorrect data source connection					
Missing credentials or wrong file path					
8. When embedding a Tableau dashboard into a secure internal portal, what two additional security measures should be implemented to ensure only authorized users can access the embedded content					
Answer:					
User Authentication (Login system / SSO)					
Row-Level Security (RLS) – restrict data based on user
